Resumo	This study aimed to establish a clinical cut-off for the self-report Conscientiousness dimension of the Dimensional Clinical Personality Inventory 2 (IDCP-2) for people with Obsessive-compulsive personality disorder (OCPD) diagnosis. The following hypotheses were raised: (1) scale should be more reliable for assessing more pathological levels compared to milder levels of conscientiousness, and (2) items should be able to discriminate OCPD patients from other groups (i.e., non-patients and mental health patients).
